PCT/SE 2003/001887

Box N . V	Reasoned statement under Article 35(2) with regard t citations and explanations supporting such statement	novelty, inventive step or industrial applicability;
-----------	---	--

#### 1. Statement

Novelty (N)	Claims	_1-14	YES NO
Inventive step (IS)	Claims Claims	1-14	YES NO
Industrial applicability (IA)	Claims Claims	1-14	YES NO

# 2. Citations and explanations (Rule 70.7)

The documents cited in the international Search Report:

D1: GB, 907 504, A
D2: US, 3 724 447, A
D3: US, 3 174 474, A
D4: US, 5 932 885, A

The claimed invention relates to a method of reducing material wear resulting from temperature gradients in a furnace heating burner.

D1, considered the most relevant document, discloses a radiant burner (figure 1) comprising an inner tube (2) and an outer tube (1), which surrounds the inner tube (2) and has a closed bottom (10). Combustion gases are intended to flow through the inner tube (2) and back through the space between the inner (2) and outer tube (1). There is arranged a plate (11) at a distance from both the aperture (6) of the inner tube (2) and the closed bottom (10) of the outer tube (1). The object of the plate (11) is to protect the closed bottom (10) from thermal load (page 1, lines 40-53). A gas space is formed between the plate (11) and the closed bottom (10) of the outer tube (1).

The burner of the invention differs from the burner of D1 the in that the inner tube is not arranged with radial apertures. This feature, however, is not clearly stated in claim 1. Apart from the construction of the inner tube the claimed burner according to claim 1 and 8 differs from the burner in D1 in that the bottom plate fully covers the cross section of the

. . . / . . .

### Supplemental Box

In case the space in any of the preceding boxes is not sufficient.

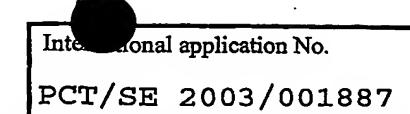

Continuation of: Box V

outer pipe. In the burner of D1 the plate (11) only covers a part of the cross section of the outer tube (1). Hence, a full shielding of the bottom of the outer tube can not be achieved with the plate (11) of D1.

None of the other cited documents discloses a method and burner arrangement as stated in claims 1-14 of the claimed invention.

Therefore, the invention defined in claims 1-14 is novel and is considered to involve an inventive step. The invention is industrially applicable.

## INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY

Box No. VIII Certain observations on the international applicati n

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

According to Article 6 PCT the claims shall be clear.

In claim 3, dependent of claim 1, it is stated that an insulating material shall occupy the volume between the inner bottom plate (8) and the bottom (9) of the outer pipe (5). However, claim 3 seems to contradict claim 1 where it is stated that a gas pocket is created

Form PCT/IPEA/409 (Box No. VIII) (January 2004)

1

# **CLAIMS**

- 1. A method relating to the operation of a burner and/or cooler (3), wherein gases are caused to flow through an inner pipe (7), out into an outer pipe (5), which has a closed bottom (9) and which surrounds the inner pipe (7), and back through that part of the volume of the outer pipe (5) not accommodated by the volume of the inner pipe (7), characterised by placing an inner bottom plate (8) in the outer pipe (5) in spaced relationship with the closed bottom (9) of said outer pipe (5) and by that the bottom plate (8) fully covers the cross-section of the outer pipe (5) and is placed perpendicular to the longitudinal axis of the outer pipe, whereby the gases flowing through the inner pipe (7) and out into the outer pipe (5) are caused to turn back towards said bottom plate (8) and pass between the outer pipe (5) and the inner pipe (7), thereby creating a gas pocket (12) between the bottom (9) of said outer pipe and the bottom plate (8).
- A method according to Claim 1, characterised by causing the throughpassing gases to either comprise hot products of combustion from combustion gas or cooling air.
- A method according to Claim 2, characterised by causing an insulating material (14) to occupy the volume between the inner bottom plate (8) and the bottom (9) of the outer pipe (5).
  - A method according to Claim 2 or Claim 3, characterised by placing an insert (10) between the bottom (9) of the outer pipe (5) and the inner bottom plate (8) to improve the bearing capacity of the inner bottom plate (8) when no insulating material is used or when the insulating material (14) that is used is not sufficiently supportive to impart a sufficiently high bearing capacity to the inner bottom plate (8).
  - A method according to Claim 4, characterised by fastening the insert (10) mechanically to the bottom (9) of the outer pipe (5).
    - A method according to Claim 4, characterised by fastening the inner bottom plate (8) mechanically to the insert (10).

5

10

25

*30* 

2

- 7. A method according to any one of Claims 1 to 6, characterised by constructing the pipe system from FeCrAl.
- 8. A burner and/or cooler (3) comprising an inner pipe (7) and an outer pipe (5) which surrounds the inner pipe (7) and has a closed bottom, wherein gases are intended to flow through the inner pipe (7) and back through that part of the volume of the outer pipe (5) which is not accommodated by the volume of the inner pipe (7), characterised by an inner bottom plate (8) which is located in the outer pipe (5) in spaced relationship with the closed bottom (9) of the outer pipe (5) and between the closed bottom of the outer pipe and the mouth of the inner pipe and by that the bottom plate (8) fully covers the cross-section of the outer pipe (5) and is placed perpendicular to the longitudinal axis of the outer pipe.
- A burner and/or cooler according to Claim 8, characterised in that the gas burner is adapted to be through-passed by gases which either consist of hot products of combustion from combustion gas or of cooling air.
- A burner and/or cooler according to Claim 9, characterised by an insulating material (14) which occupies the volume between the inner bottom plate (8) and the bottom (9) of the outer pipe (5).
- A burner and/or cooler according to Claim 9 or Claim 10, when no insulating material is used or when the bearing capacity of any insulating material (14) used is insufficient to impart a sufficiently high bearing capacity to the inner bottom plate (8), characterised by an insert (10) which is placed between the bottom (9) of the outer pipe (5) and the inner bottom plate (8) such as to enhance the bearing capacity of the inner bottom plate (8).
- A burner and/or cooler according to Claim 11, characterised in that the insert (10) is fastened mechanically to the bottom (9) of the outer pipe (5).
- 30 13. A burner and/or cooler according to Claim 11, characterised in that the inner bottom plate (8) is fastened mechanically to the insert (10).
  - A burner and/or cooler according to any one of Claims 8 to 13, characterised in that the pipe system is comprised of FeCrAl.
